Microbiome and Metagenomics

Erik Hjerde

Overview of this talk

Microorganisms

Microbiomes – humane microbiome

Metagenomics

Microbes are single-cell organisms (bacteria, archaea, eukaryotes) and virus

Extreme diversity in appearance and capabilities

Bacteria can be classified into taxonomic levels

Microbial habitats - microbes are found "everywhere"

Microbes are found "everywhere", from the outermost part of the atmosphere to interior of the amniotic sac

Superbakterier truer romstasjonen

Farlige bakterier har kolonisert den internasjonale romstasjonen ISS, men nå slår vitenskapen tilbake.

We are utilizing the functional capabilities of microbes

Important in e.g. food industry

We are utilizing the functional capabilities of microbes

Important in e.g. food industry, but could microbes potentially be lethal to us

S/Africa identifies source of deadly listeriosis outbreak

O March 05, 2018 to 05:58

APA-Pretoria (South Africa)

Food from a bologna-making factory in the South African city of Polokwane in northern Limpopo Province is the source of the deadly listeriosis outbreak in the country which has so far killed 180 people and affected 915 others, a senior official said on Sunday.

How many different microbial species are there?

Estimated $10^{12} - 10^{19}$ microbial species – We have described 10^4

Earth surface = 510 100 000 km²

Lisboa city centre = 5,1 km²

«Microbial dark matter»

Estimated to be > 1000 bacterial phyla – we have described 92...

16S rRNA tree of known bacterial phyla

Microbiome is all microbes in a particular environment

The species diversity can be enormous, and often different species collaborate to perform processes

Microbiota is often used for a particular niche

The oral microbiota = microbiome in the oral cavity contain ~1000 bacterial species Multiple species collaborate in producing dental plaque

Many types microbiome - Human Beardome

New discoveries open for new usages

The humane microbiome: ~10x more bacterial cells than human cells

Microbes can break down and produce essential compounds that we can not produce The human microbiome project – Description of a healthy human microbiome

How can we study and understand microbiomes?

Around 1% of the microbes in the gut are directly cultivable

Metagenomics is the study of genetic material recovered directly from environmental samples

Aim often to explore the relation between the microbes and habitats

Metagenomic has multiple applications – some examples

- Study microbiome-host relationship
- Study microbiome differences in healthy and sick individuals
- Study microbiome variations after intervention
- Discover new species explore the microbial dark matter

Lean versus obese twins

Obese individuals have lower diversity Lean individuals have more *Christensenellaceae*

Faecal transplantation to germ-free mice:

- From obese donors
- From lean donors
- From obese donors + Christensenellaceae
- = lean mouse

= lean mouse

= obese mouse

Nan Pazdernik, PhD, Technical Training and Education Specialist, IDT

Microbiome variation after change in diet

Changing from Mediterranean to American diet change the composition of the microbiome and is detectable the same day
