

# **STRING and Cytoscape for proteomics data analysis**

**Nadezhda T. Doncheva**

**[nadezhda.doncheva@cpr.ku.dk](mailto:nadezhda.doncheva@cpr.ku.dk)**

**Integrative Biological Interpretation using Proteomics 2022**

**Instituto Gulbenkian de Ciência, Oeiras, Portugal**

**June 20 – June 24, 2022**

# Intended learning outcomes

- Describe types of biological networks and give at least one example for such a network and where to find it
- Characterize a network in terms of what it represents
- Perform functional enrichment on a list of genes
- Analyze (your) high-throughput data using Cytoscape
  - Import your data into Cytoscape using the stringApp
  - Master network layouts and data visualization
  - Perform clustering and enrichment analyses
- Know where to find relevant documentation and tutorials

# High-throughput technologies

Proteomics

Microarray

scRNA-seq

RNA-seq

Volcano plot

Heatmap

Adapted from Griss *et al.*, *Mol & Cell Prot*, 2020.

# A typical table with data

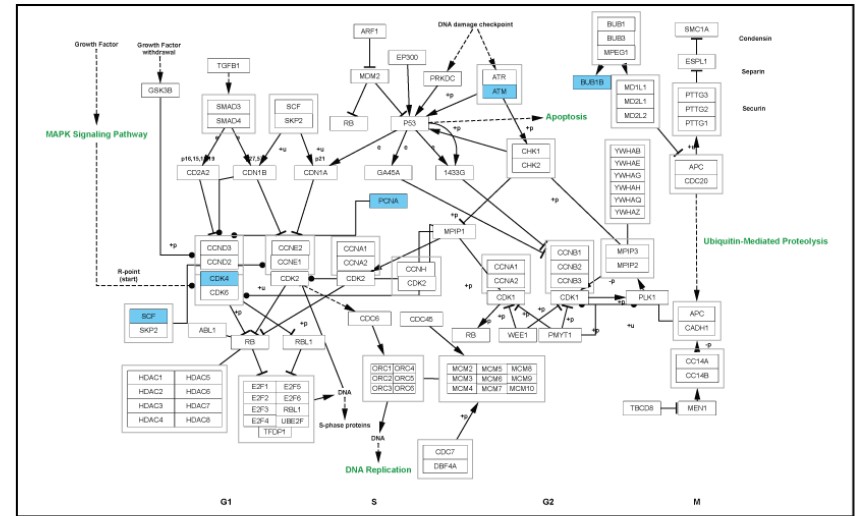

- Temporal analysis by mass spectrometry of the proteome of neuroblastoma cells in response to nerve growth factor (NGF)
- Identification of 78 proteins that interact with tropomyosin-related kinase A (TrkA) upon NGF stimulation

	A	B	C	D	G	J

# What are networks?

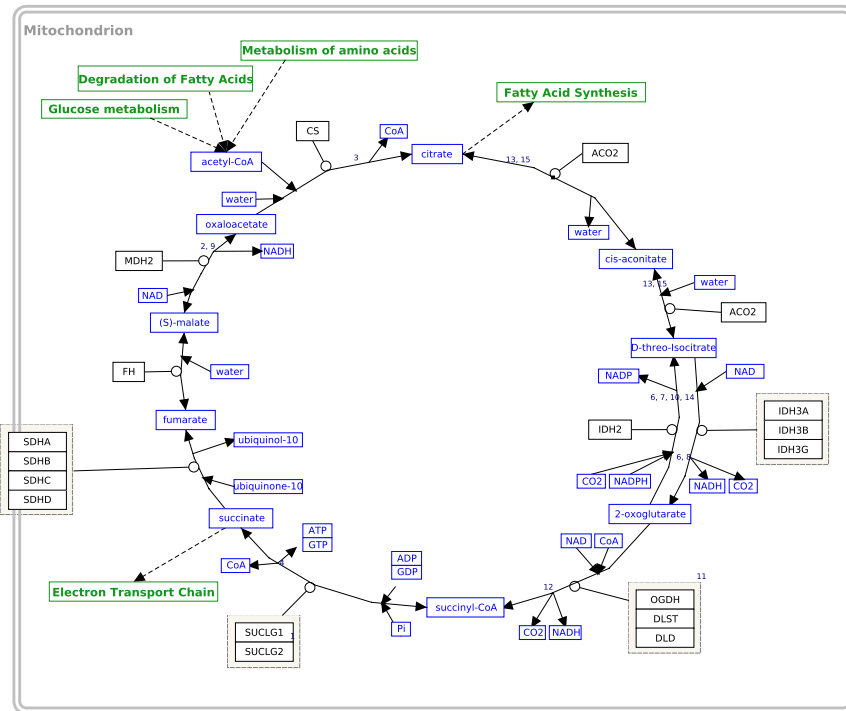

- Consist of nodes (vertices, circles) and edges (links, lines)
- Represent relationships between entities
- Networks are everywhere...
  - Social networks
  - The power grid
  - The internet
- Can you think of 1 or 2 examples for networks in your field?

# Types of biological networks

- **Pathways:** metabolic, signaling, regulatory, etc.
- For example KEGG
- **Interaction networks:** protein-protein, protein-drug, etc.
- For example STRING

# Sources of biological networks

- There are hundreds of different interaction databases
- It depends on your biological question and analysis plan

*But know what you are getting...*

- **Interaction networks:** broad coverage / lower resolution
  - STRING (<https://string-db.org/>)
  - IntAct (<https://www.ebi.ac.uk/intact/>)
  - BioGrid (<https://thebiogrid.org/>)
- **Pathways:** higher resolution / limited coverage
  - KEGG (<https://www.kegg.jp/kegg/pathway.html>)
  - Reactome (<https://reactome.org/>)
  - WikiPathways (<https://www.wikipathways.org/>)

# STRING exercise 1 (15 min)

<https://jensenlab.org/training/string/eubic/>

In this exercise, we use the STRING database to create a network for one protein of interest and explore the different visual representation and the supporting evidence of the interactions.

## **Exercise 1.1: Single protein query**

*Question 1: Why are there multiple lines connecting the same two proteins?*

## **Exercise 1.2: Visual representations**

*Question 2: Which information is shown for the edges in each representation?*

## **Exercise 1.3: Evidence viewers**

*Question 3: Which types of evidence support the interaction between insulin receptor (INSR) and insulin receptor substrate 1 (IRS1)?*

*Question 4: Which type of evidence gives the largest contribution to the confidence score 0.999?*

*Question 5: Which types of experiments support this interaction?*

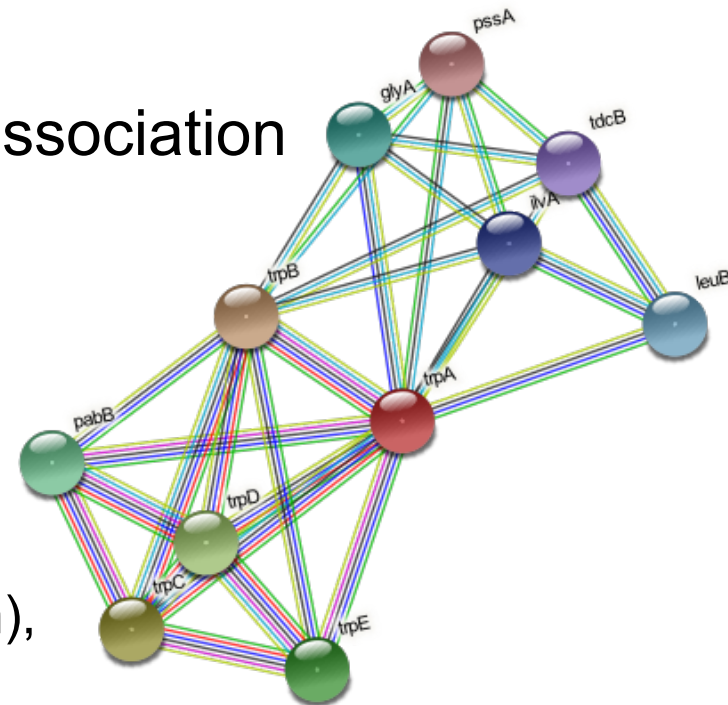

# STRING

→ Integration of known and predicted functional protein associations

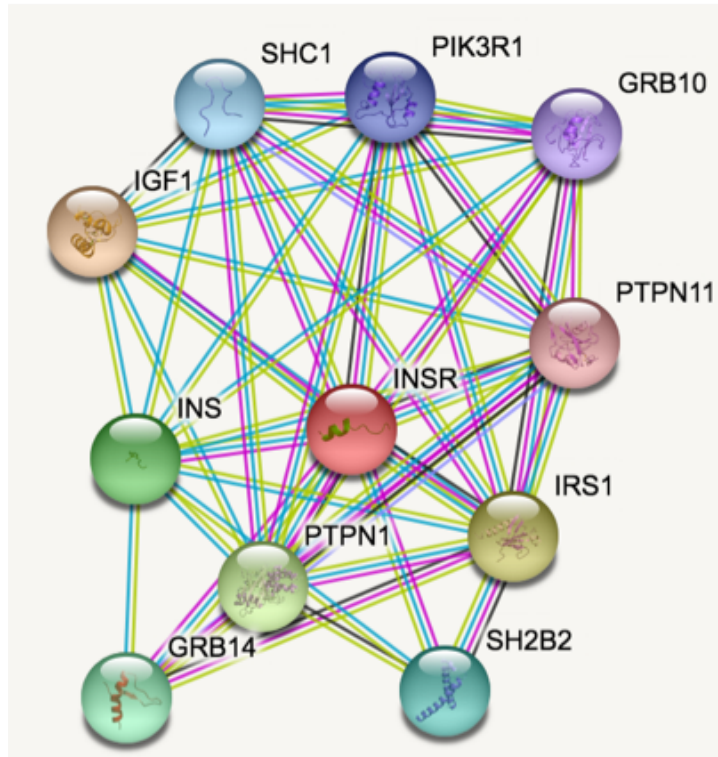

- Collect multiple types of evidence for known associations
- Predict new associations
- Transfer across species
- Assign confidence score to each association

Joint collaboration between the groups of Christian von Mering (University of Zurich), Lars Juhl Jensen (University of Copenhagen), and Peer Bork (EMBL Heidelberg)

# STRING evidence channels

## Known Interactions

*from curated databases*

*experimentally determined*

## Predicted Interactions

*gene neighborhood*

*gene fusions*

*gene co-occurrence*

## Others

*textmining*

*co-expression*

*protein homology*

# Predictions from genomic context

**Gene fusion**

**Gene neighborhood**

**14,094 organisms**

**Gene co-occurrence  
(phylogenetic profiles)**

# Experimental evidence

**Experiments**

Pair-wise interactions from experiments in curated databases like IntAct & BioGrid

Can be any type of *biochemical, biophysical or genetic interaction, like pull-down experiments*

**Co-expression**

Look for consistent similarities between expression profiles in many different conditions  
Mainly RNA-based expression data + a bit of protein expression

# “Higher-level” knowledge

Also known as *Databases*  
Curated pathway databases like  
KEGG & Reactome

Co-occurrence text mining for  
functional associations  
Natural language processing for  
physical interactions

# STRING scores

- However, it is not that simple:
  - Many databases
  - Different formats
  - Different identifiers
  - Variable quality
  - Not comparable
  - Not the same species
- Quality scores [0,1] based on a gold standard
  - Common scale for comparison
  - Implicit weighting by quality

Interaction

● INSR [ENSP00000303830]  
Insulin receptor; Receptor tyrosine kinase which mediates the pleiotropic actions of insulin. Binding of insulin leads to phosphorylation of several intracellular substrates, including, insulin receptor substrates (IRS1, 2, 3, 4), SHC, GAB1, CBL and other signaling intermediates. Each of these phosphorylated proteins serve as docking proteins for other signaling proteins that contain Src- homology-2 domains (SH2 domain) that specifically recognize different phosphotyrosine residues, including the p85 regulatory subunit of PI3K and SHP2. Phosphorylation of IRSs proteins lead to the acti [...]

↔

● PIK3R1 [ENSP00000428056]  
Phosphoinositide-3-kinase regulatory subunit alpha/beta /delta; Phosphatidylinositol 3-kinase regulatory subunit alpha; Binds to activated (phosphorylated) protein-Tyr kinases, through its SH2 domain, and acts as an adapter, mediating the association of the p110 catalytic unit to the plasma membrane. Necessary for the insulin-stimulated increase in glucose uptake and glycogen synthesis in insulin-sensitive tissues. Plays an important role in signaling in response to FGFR1, FGFR2, FGFR3, FGFR4, KITLG/SCF, KIT, PDGFRA and PDGFRB. Likewise, plays a role in ITGB2 signaling. Modulates the ce [...]

**Evidence suggesting a functional link:**

Neighborhood in the Genome:	none / insignificant.	
Gene Fusions:	none / insignificant	
Cooccurrence Across Genomes:	none / insignificant	
Co-Expression:	none, but putative homologs are coexpressed in other organisms (score 0.062).	show
Experimental/Biochemical Data:	yes (score 0.870). In addition, putative homologs were found interacting in other organisms (score 0.227).	show
Association in Curated Databases:	yes (score 0.900).	show
Co-Mentioned in Pubmed Abstracts:	yes (score 0.457). In addition, putative homologs are mentioned together in other organisms (score 0.208).	show

Combined Score: 0.995

# STRING score calibration

**STRING**

**confidence score**

(how likely are two proteins part of the same KEGG pathway)

# STRING network views

What is the difference between these two views?

Evidence view

Confidence view

# NG network types

vs. physical interactions

New since STRING v11.5

# STRING exercise 2 (20 min)

<https://jensenlab.org/training/string/eubic/>

In this exercise, we will work with a list of proteins associated with epithelial ovarian cancer (EOC) in the study by [Francavilla et al.](#) and learn how to query STRING for multiple proteins, change the query parameters and do functional enrichment.

## **Exercise 2.1: Multiple proteins query**

*Question 1: How many nodes and edges are in the resulting network?*

## **Exercise 2.2: Query parameters**

*Question 2: How does changing the confidence or network type influence the set of interactions shown?*

*Question 3: What evidence types are available for the physical interactions? Are there more or fewer evidence types than in the full STRING network?*

## **Exercise 2.3: Functional enrichment**

*Question 4: How many categories contain enriched annotation terms?*

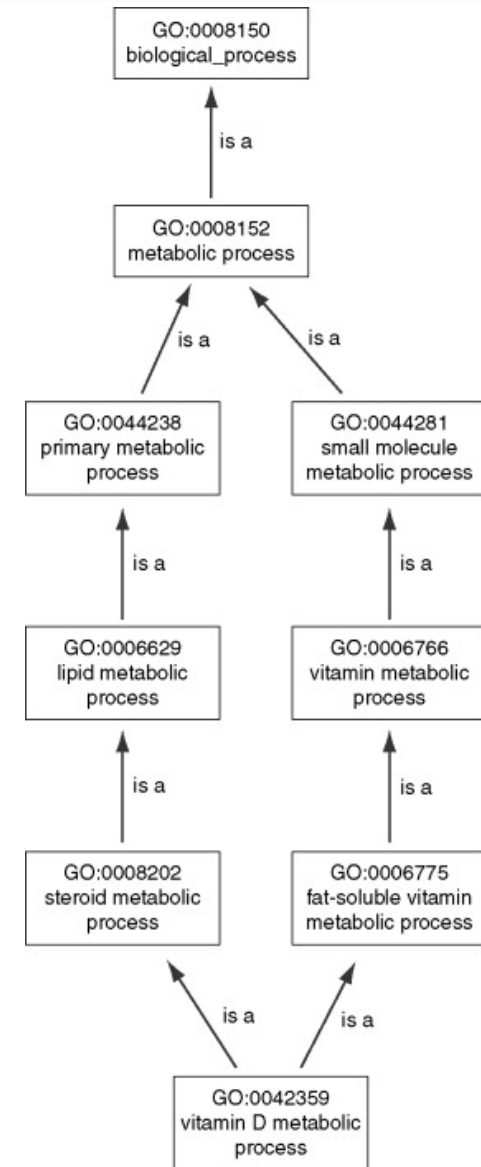

*Question 5: What information is shown in each line of the table? How can you find out more about this annotation term?*

*Question 6: Do the pathways annotate the same set of genes or not?*

# Functional enrichment analysis

- *aka* over-representation analysis
- A *term* is usually a *pre-defined group* of genes, with the same function or the same process, e.g. a pathway like *TCA cycle* or a Gene Ontology term like *mRNA processing*
- Identify terms that are statistically over-represented for a set of *regulated* genes compared to a background set of genes
- Fisher's exact test followed by multiple testing correction
- Choosing the *right* background is very important: genome-wide vs. user-defined

Gene ontology example

# Enrichment in STRING

Viewers > Legend > Settings > Analysis > Exports > Clusters > More > Less >

## Network Stats

number of nodes: 11	expected number of edges: 14
number of edges: 48	PPI enrichment p-value: 1.05e-12
average node degree: 8.73	<i>your network has significantly more interactions than expected (what does that mean?)</i>
avg. local clustering coefficient: 0.917	

## Functional enrichments in your network

*Note: some enrichments may be expected here (why?)*

*explain columns*

Import and augment Cytoscape networks from STRING

(22) [122414 downloads](#) | [citations](#) | [discussions](#)

Details

Release History

Categories: [annotation](#), [automation](#), [data visualization](#), [disease](#), [enrichment analysis](#), [gene-disease association](#), [gene function prediction](#), [import](#), [interaction database](#), [network generation](#), [online data import](#), [PPI-network](#), [visualization](#)

*stringApp* imports functional associations or physical interactions between protein-protein and protein-chemical pairs from [STRING](#), [Viruses.STRING](#), [STITCH](#), [DISEASES](#) and from PubMed text mining into Cytoscape. Users provide a list of one or more gene, protein, compound, disease, or PubMed queries, the species, the network type, and a confidence score and *stringApp* queries the database to return the matching network. Currently, four different queries are supported:

- **STRING: protein query** -- enter a list of protein names (e.g. gene symbols or UniProt identifiers/accession numbers) to obtain a STRING network for the proteins
- **STRING: PubMed query** -- enter a PubMed query and utilize text mining to get a STRING network for the top N proteins associated with the query
- **STRING: disease query** -- enter a disease name to retrieve a STRING network of the top N proteins associated with the specified disease
- **STITCH: protein/compound query** -- enter a list of protein or compound names to obtain a network for them from STITCH

# Let's try it out!

How many have installed Cytoscape **3.9.1**?

If not installed yet, get it from here:

<http://cytoscape.org/download.php>

# Launch Cytoscape

The screenshot shows the Cytoscape application window with a menu bar (File, Edit, View, Select, Layout, Apps, Tools, Help) and a toolbar. The main workspace is currently empty, displaying "No networks selected". The interface is divided into several panels:

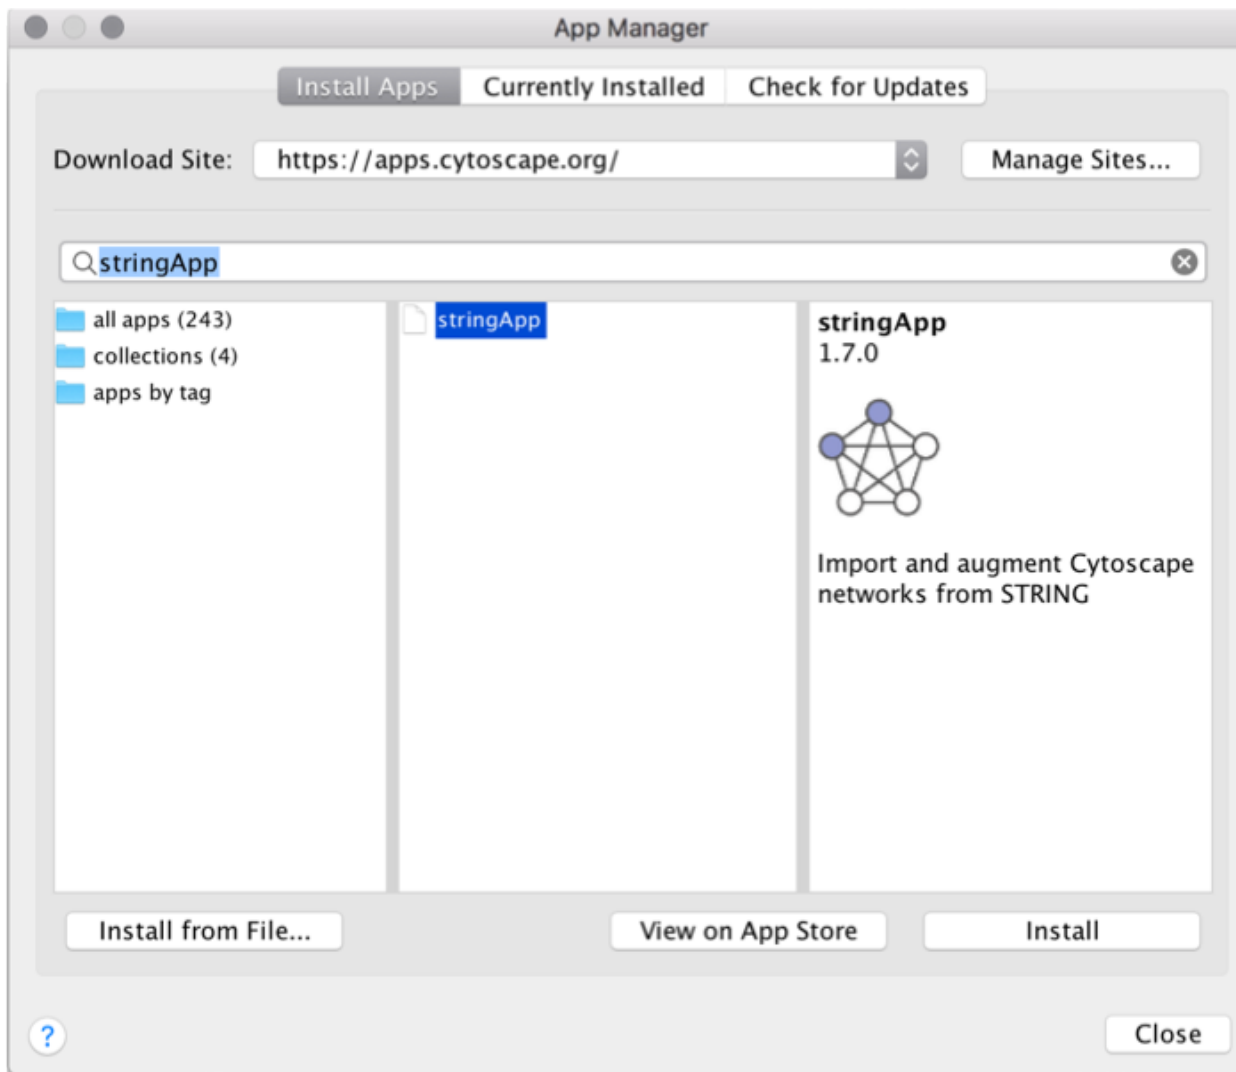

- Control panel:** Located on the left side, it contains a list of networks, visual styles, selection filters, and layout tools.
- Table panel:** Located at the bottom, it contains a Node Attributes Table and an Edge Attributes Table.
- Network view:** The central workspace where the network is displayed.
- Zoom in/out:** A callout box pointing to the zoom controls in the toolbar.
- Default layout:** A callout box pointing to the layout tools in the toolbar.

At the bottom of the window, there are status icons and a "Load Preset Styles" button.

# Install stringApp v1.7.1

# stringApp exercise 1 (10 min)

<https://jensenlab.org/training/stringapp/eubic/>

In this exercise, we will perform some simple queries to retrieve molecular networks in Cytoscape using the stringApp.

## Exercise 1.1: Protein query

***Question 1:** How many nodes are in the resulting network? What types of information do the **Node Table** and the **Edge Table** provide?*

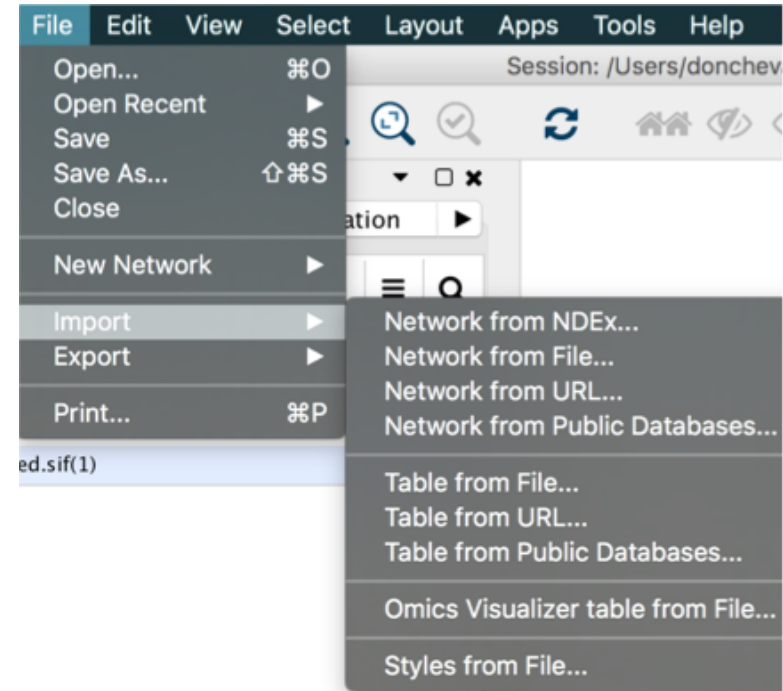

## Exercise 1.2: Disease query

***Question 2:** Which additional attribute column do you get in the **Node Table** for a disease query compared to a protein query? Hint: check the last column.*

# Import network (edge) data

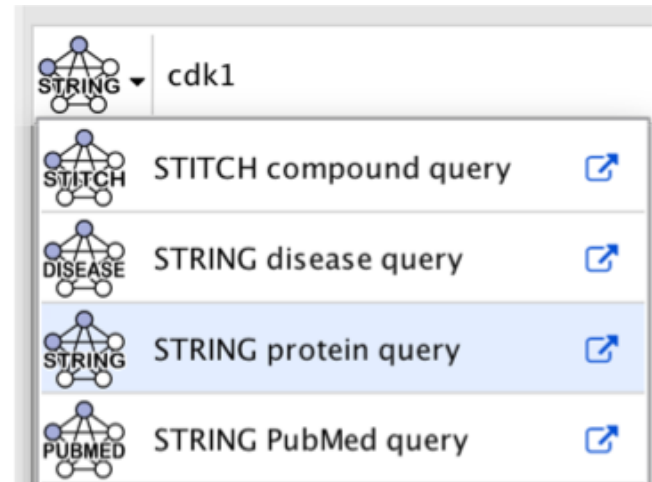

- **Starting with a list of genes, no network data**
  - stringApp
  - GeneMANIA app
  - IntAct app
- **Pathway databases**
  - KEGGscape app
  - ReactomeFI app
  - WikiPathways app
- **Your own network data**
  - from files, e.g. Excel tables or text files
  - from R or Python via automation

# stringApp

- **STRING protein query**
  - Queries for STRING interactions for **one** protein or for a **list** of identifiers
- **STRING compound query**
  - Queries for protein-compound interactions
- **STRING disease query**
  - Queries for disease-associated proteins from DISEASES and for STRING interactions between them
- **STRING PubMed query**
  - Retrieves STRING interactions for proteins co-occurring with the query term in PubMed

# STRING protein query

## Visual Styles

# Visualize data using styles

- Visual attributes
  - **Nodes:** fill color, border color, border width, size, shape, opacity, label, etc.
  - **Edges:** line style, line color, line width, line opacity, ending type, ending color, etc.
- Mapping types
  - **Continuous (numeric values)**
    - Expression values, edge interaction scores
  - **Discrete (categories)**
    - Type of interaction, protein family
  - **Pass-through (labels)**
- Pre-defined visual styles

# STRING network in Cytoscape

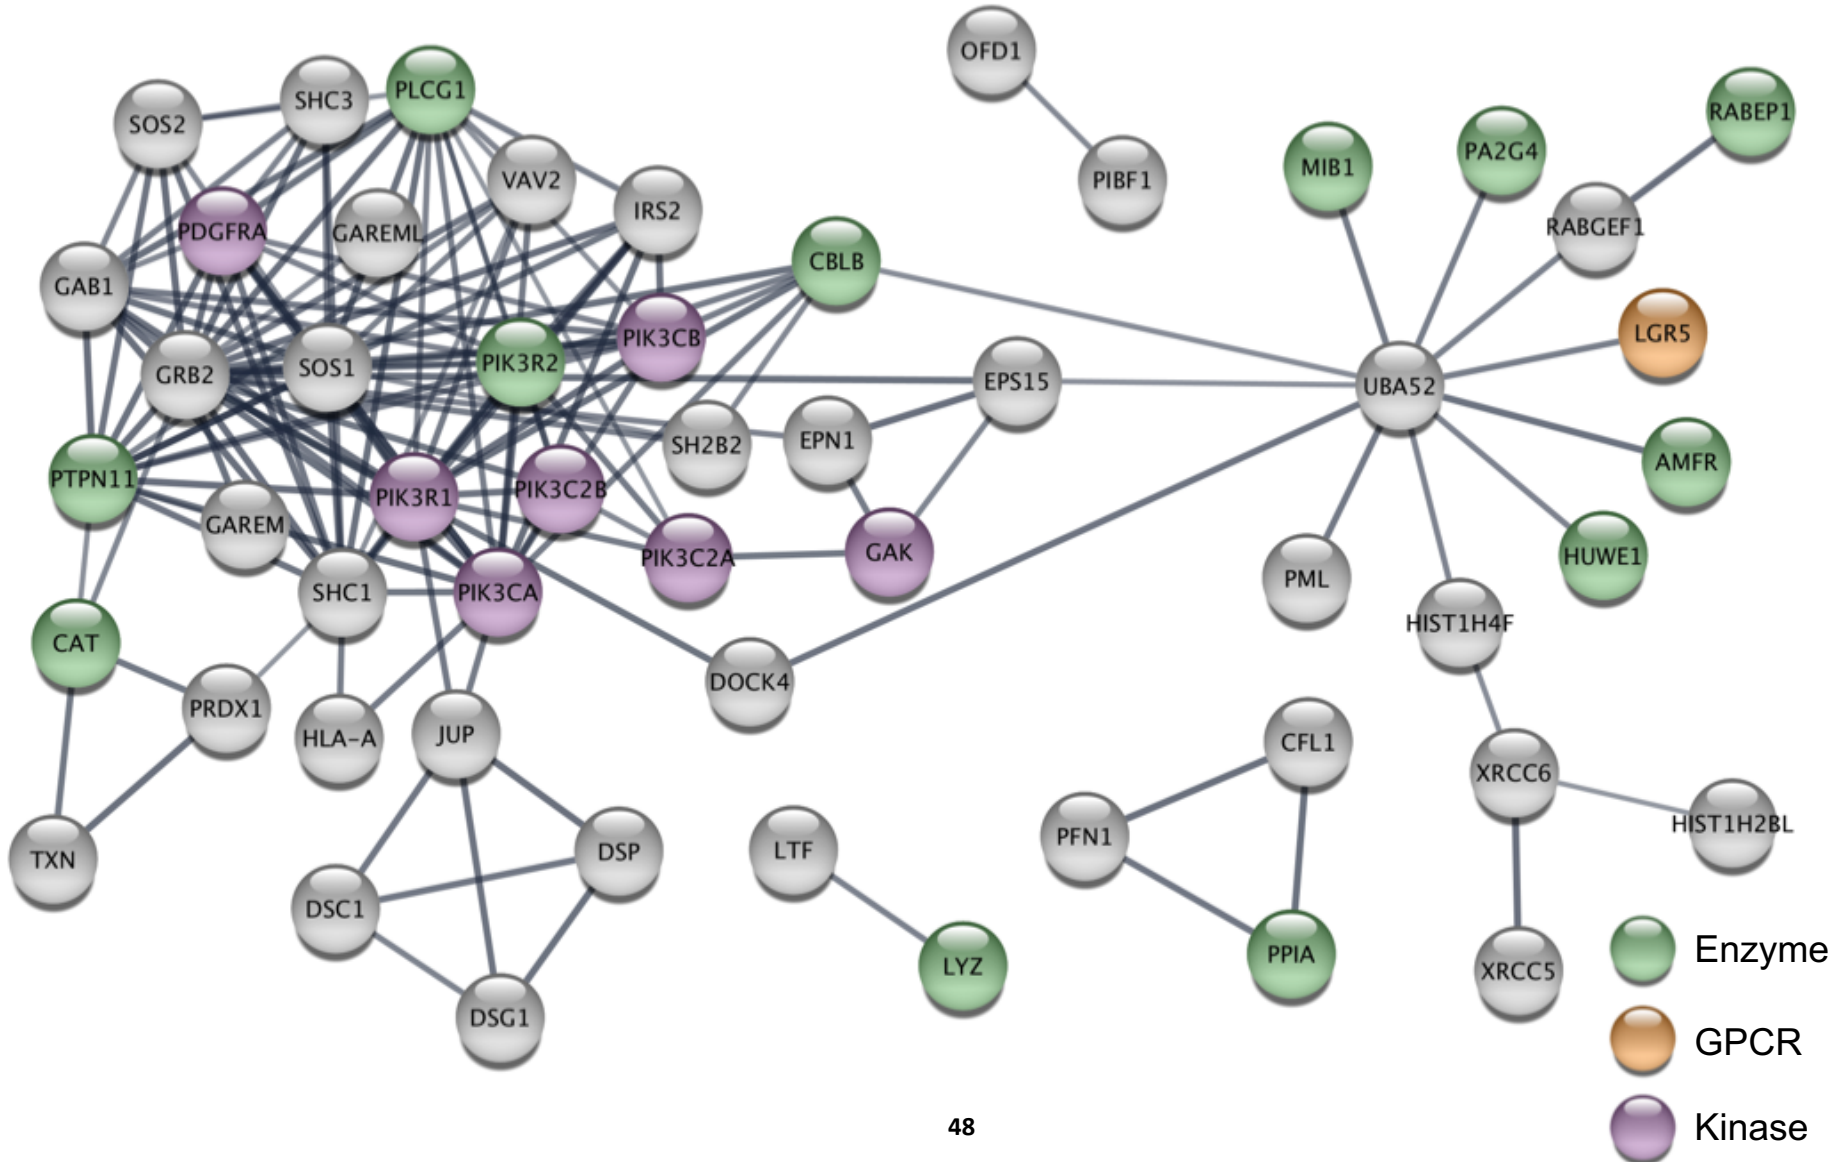

# STRING network in Cytoscape

# Pharos drug target information

Discrete mapping: node color

# Pharos drug target information

Discrete mapping: node color & node size + Bypass: node labels

# STRING network in Cytoscape

# Expression data as node colors

## Continuous mapping: node color

# Data Mapping: Tips

- Avoid cluttering your visualization with too much data
  - Highlight meaningful differences
  - Avoid confusing the viewer
  - Consider creating multiple network images

# Styles: User interface

**Styles tab**

**Available styles**

**Default fill color: grey**

**Fill color mapping:  
rainbow colors**

**Bypass mapping**

**Node tab**

**Edge tab**

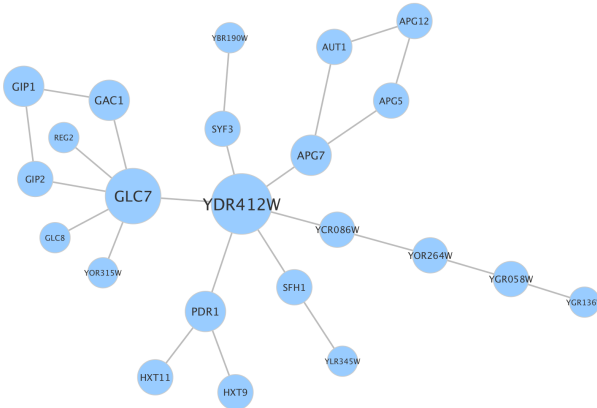

The screenshot shows the 'STRING style v1.5' user interface. The top bar displays the style name and a menu icon. Below it, the 'Properties' section is divided into three columns: 'Def.', 'Map.', and 'By.'. The 'Fill Color' property is highlighted, showing a grey square in the 'Def.' column and a rainbow color swatch in the 'Map.' column. The 'By.' column for 'Fill Color' has a bypass icon (two vertical bars with a diagonal slash). Other properties include 'Border Paint', 'Border Width', 'Height', 'Image/Chart 1', 'Image/Chart 2', 'Label', 'Label Color', 'Label Font Size', 'Shape', 'Size', 'Transparency', and 'Width'. A 'Lock node width and height' checkbox is checked at the bottom. The left sidebar contains icons for 'Network', 'Style', 'Filter', 'Annotation', 'Sets', 'Legend Panel', and 'Layout Tools'. The bottom of the window has three tabs: 'Node', 'Edge', and 'Network', with 'Node' currently selected.

Def.	Map.	By.	Property
			Border Paint
0.0			Border Width
			Fill Color
			Height
			Image/Chart 1
			Image/Chart 2
			Label
			Label Color
12			Label Font Size
			Shape
30.0			Size
255			Transparency
			Width

# Layouts

- Layouts determine the location of nodes and (sometimes) the paths of edges
- Recommended apps: yFiles Layout Algorithms, layoutSaver

Force-directed

Circular

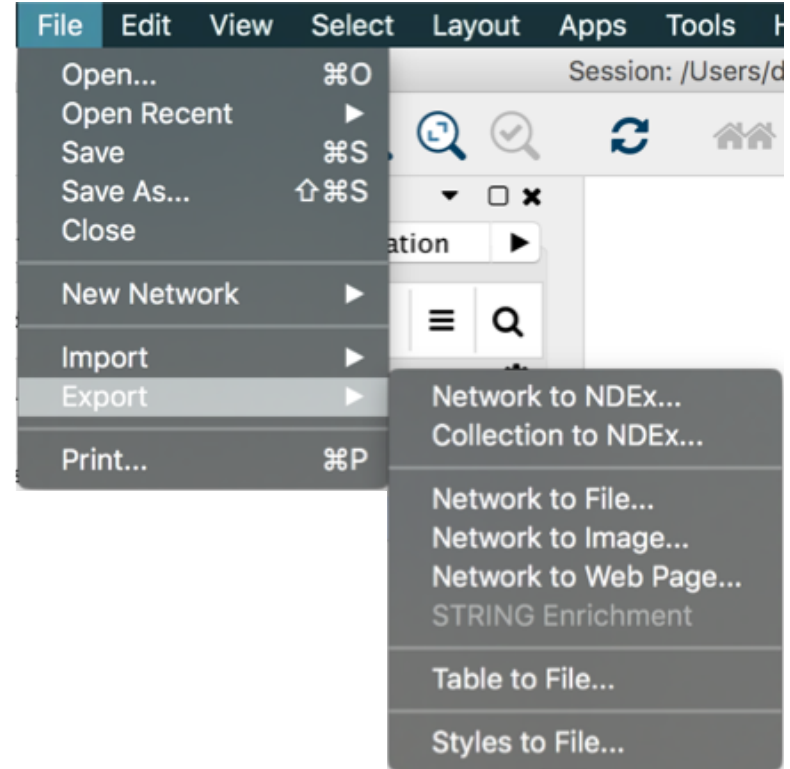

Hierarchical

# Save data

- **Cytoscape sessions** save everything (.cys files)
- Export networks in different formats
- Export node & edge tables as text files
- Publication quality graphics in several formats

# stringApp exercise 2 (20 min)

<https://jensenlab.org/training/stringapp/eubic/>

In this exercise, we will work with the list of proteins associated with epithelial ovarian cancer (EOC) in the study by [Francavilla et al.](#) to perform typical network import and visualization tasks.

## 2.1 Protein network retrieval & layout

**Question 1:** *How many nodes and edges are there in the resulting network? Do the proteins all form a connected network? Why?*

**Question 2:** *Does any of the suggested layouts make patterns in the network easy to recognize? (Recommended: install the app **yFiles Layout Algorithms**)*

## 2.2 Discrete color mapping

*Questions: How many of the proteins in the network are ion channels (IC) or GPCRs? How many kinases are in the network?*

## 2.3 Data import

**Question 4:** *Do you see the columns from the Excel table in the Node Table?*

## 2.4 Continuous color mapping

**Question 5:** *Are the up-regulated nodes grouped together? Do you see any issues with the color gradient and can you improve it?*

# Why use (biological) networks?

- Networks are **powerful tools**

- ✓ Reduce complexity
- ✓ More efficient than tables
- ✓ Great for data integration
- ✓ Intuitive visualization

- But also... Challenging!

- Many different network analysis and visualization techniques available

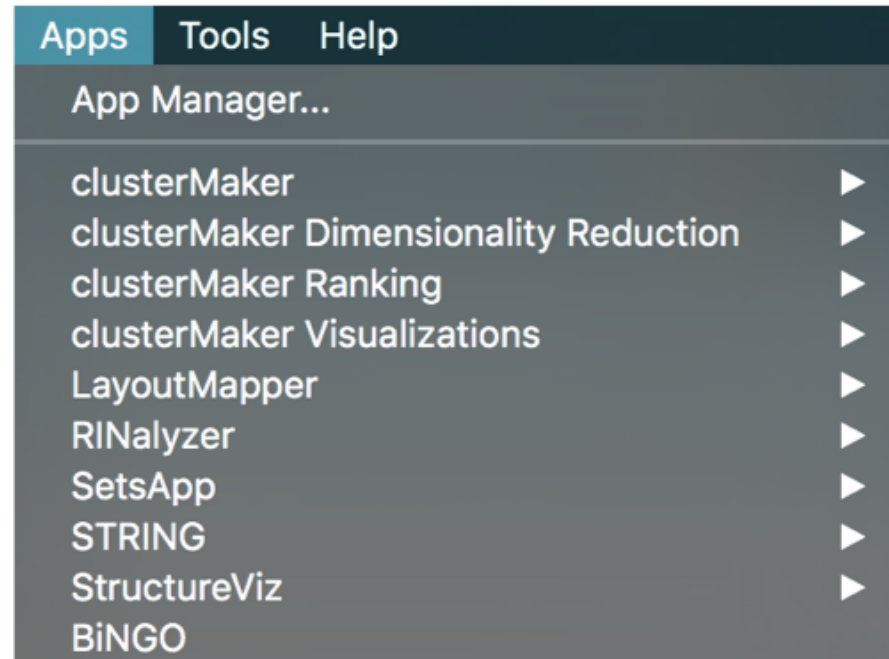

# Annotate & analyze the network

- Functional enrichment
- Topological analysis
- Clustering
- And many more...

→ Visit the Cytoscape app store at <https://apps.cytoscape.org/>

# Network clustering

- Group nodes together based on some measure of distance or similarity between the nodes
- Makes the network easier to understand
- MCL (Markov CLustering)
  - Fast algorithm
  - No need to specify number of clusters

# Clustering in Cytoscape

## clusterMaker2

Multi-algorithm clustering app for Cytoscape

★★★★☆ (23) 89244 downloads | citations | discussions   

Details

Release History

Categories: automation, clustering, data visualization, gene expression, grouping, heat map visualization, visualization

clusterMaker2 is the Cytoscape 3 version of the clusterMaker plugin. clusterMaker2 provides several clustering algorithms for clustering data within columns as well as clustering nodes within a network. This version also provides support for two new algorithms: Fuzzy C-Means and a new "Fuzzifier". In addition to providing clustering algorithms, clusterMaker2 provides heatmap visualization of both node data and edge data as well as the ability to create new networks based on the results of a clustering algorithm.

Current node attribute algorithms:

- Hierarchical
- K-Means
- K-Medoid

CYTOSCAPE 3

 Download

Version 1.3.1

Released 30 Oct 2018

Works with Cytoscape 3.6

# stringApp functional enrichment

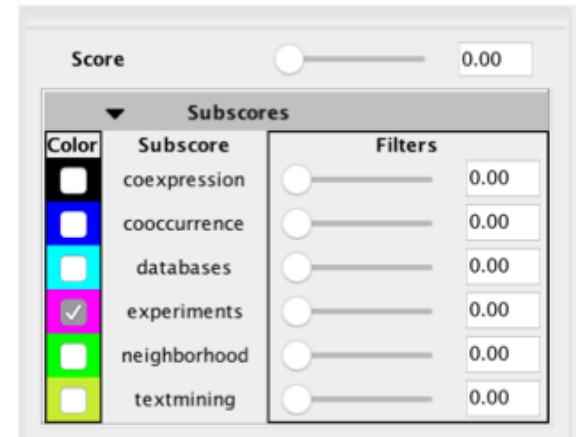

- Not really a network analysis technique, but very **useful for visualization**
- Filter by category, remove redundant terms
- Visualize significant terms
- Many categories: Gene Ontology terms, Reactome, KEGG & Wiki pathways, Tissues, Diseases, Subcellular localization, STRING clusters, Protein domains, Publications

# More stringApp features

- Change confidence level of interactions → important when merging networks
- Expand network by a user defined number of additional interactors → for example compounds
- Filter nodes by tissue or compartment annotation
- Filter and color edges by evidence
- Stringify networks not created with the stringApp
- Query for virus-host interactions

# Useful apps & features

- Functional enrichment: stringApp, clueGO & CluePedia, BiNGO, EnrichmentMap
- Clustering: clusterMaker2
- Merge networks: Cytoscape built-in (Tools → Merge)
- Omics data visualization: OmicsVisualizer
- Pathways: KEGGscape, WikiPathways, ReactomeFI, OmniPath
- Network topology: Cytoscape built-in (Tools → Analyze network)

# stringApp exercise 3 (10 min)

<https://jensenlab.org/training/stringapp/eubic/>

In this exercise, we will work with the list of differentially abundant proteins from the study by [Francavilla et al.](#) and perform typical network analysis tasks.

**Prerequisites:** *install the app **ClusterMaker2***

## 3.1 Network clustering

**Question 1:** *How many clusters have at least 10 nodes?*

**Question 2:** *How many nodes and edges are there in this cluster?*

## 3.2 Functional enrichment

**Question 3:** *How many statistically significant terms are in the table? Which is the most significant term for each of the categories GO Biological Process, Reactome and KEGG Pathways?*

## 3.3 Functional enrichment extras

**Question 4:** *What is the title of the most recent publication?*

# stringApp exercise 4 (10 min)

<https://jensenlab.org/training/stringapp/eubic/>

In this exercise, we will compare the network of differentially abundant proteins from the study by [Francavilla \*et al.\*](#) and the network of genes associated with the same disease based on literature and knowledge from the [DISEASES](#) database.

## 4.1 Overlap with DISEASES network

*Question 1: How many nodes are in the intersection?*

## 4.2 Integrate networks

*Question 2: Which protein from the experiment has the highest disease score?*

*Question 3: Can you find the protein with the highest disease score in the network view?*

# Complex input data tables

	A	B	C	D	E	F	G	H	I	J
1	UniProt	Gene name	Modified sequence	AA position	EOC	FTE	OSE	EOC vs FTE	EOC vs OSE	Adj p-value

- Usual workflow: given a list of proteins, import a STRING network and add experimental data from the table
- But what to do with multiple lines of data for one node? Aggregate the data or select the "best" site?
- ⇒ How to visualize multiple lines of data for one node?

# Omics Visualizer features

- Import multi-omics data as an **Omics Visualizer table**
- Retrieve a STRING network for the proteins in the table
- Visualize data (e.g. phospho-site specific) as pies inside the nodes or donuts around the nodes

# Donut visualization

Data: two different conditions as two columns, several phospho sites for each protein as different rows

*Ring as column = condition  
(Slice as row)*

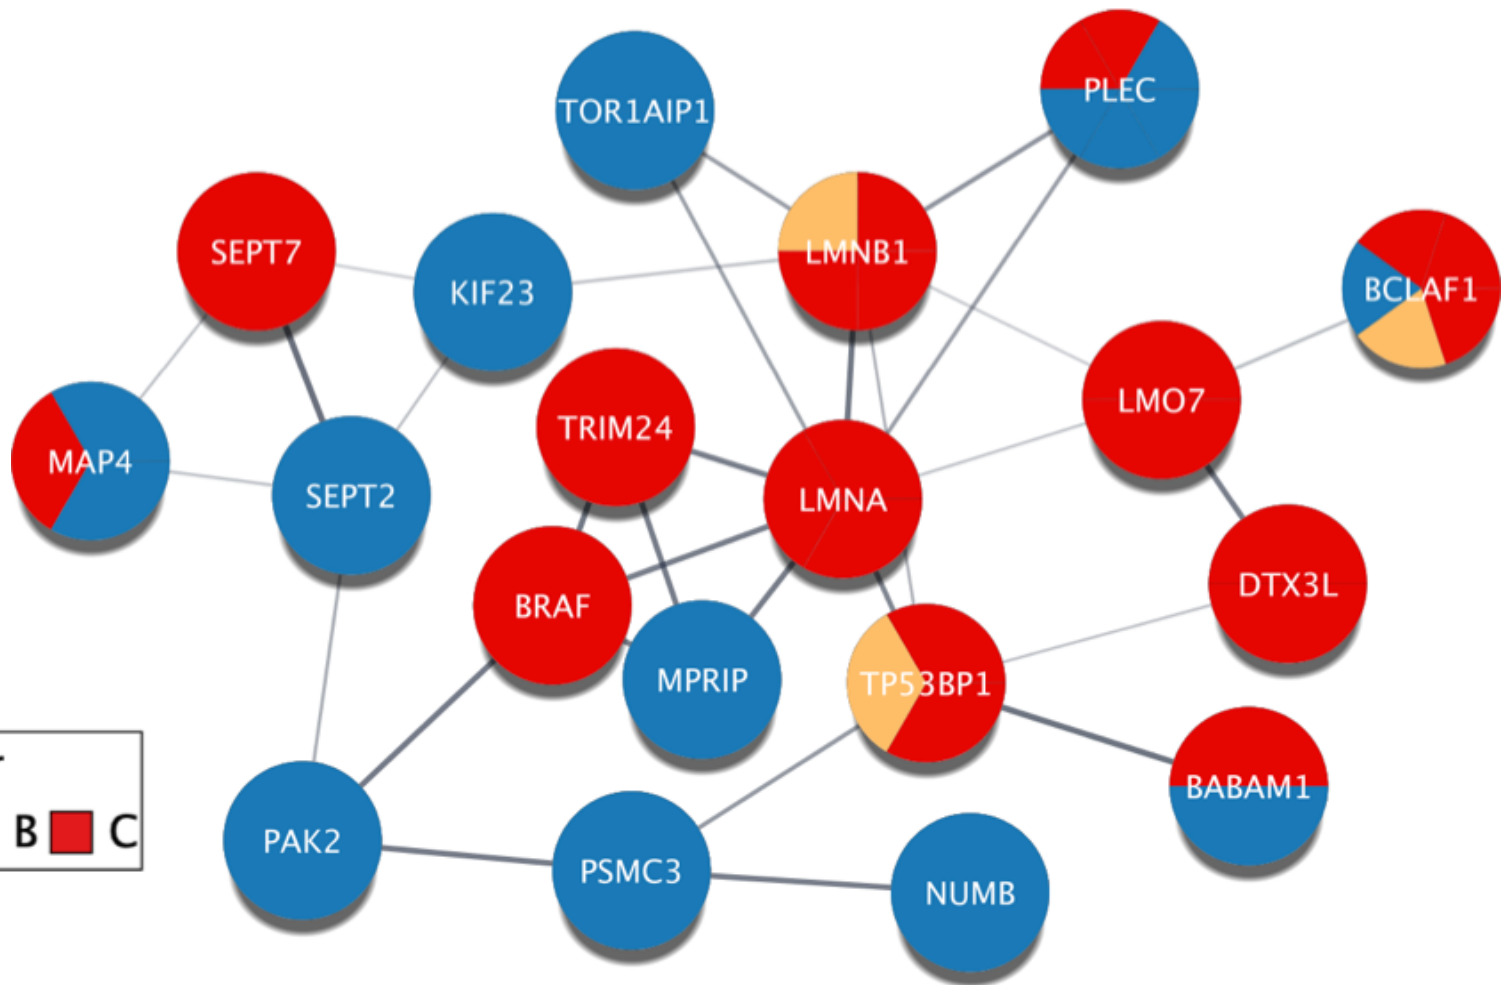

*Ring as row = phospho side  
(Slice as column)*

# Pie visualization

Note: only possible for one data column!

There is also an automatically generated legend!

# Omics Visualizer ex. 1 (20 min)

<https://jensenlab.org/training/omicsvisualizer/>

In this exercise, we will work with the list of 541 differentially abundant proteins from the study by [Francavilla et al.](#) with focus on the phosphorylation data.

**Prerequisites:** *install the app **OmicsVisualizer***

## 1.1 Table import

## 1.2 Table row filtering

**Question 1:** *How many rows do you have in the table? How many rows are shown after you applied the filter?*

## 1.3 STRING network retrieval

**Question 2:** *How many nodes do you have in your network? Does it corresponds to the number of rows you queried?*

## 1.4 Donut visualization

**Question 3:** *How are multiple sites on the same protein shown? Do different donut slices within a protein always show similar changes?*

## 1.5 Pie visualization

**Question 5:** *What are the advantages and disadvantages of donut vs. pie visualizations?*
