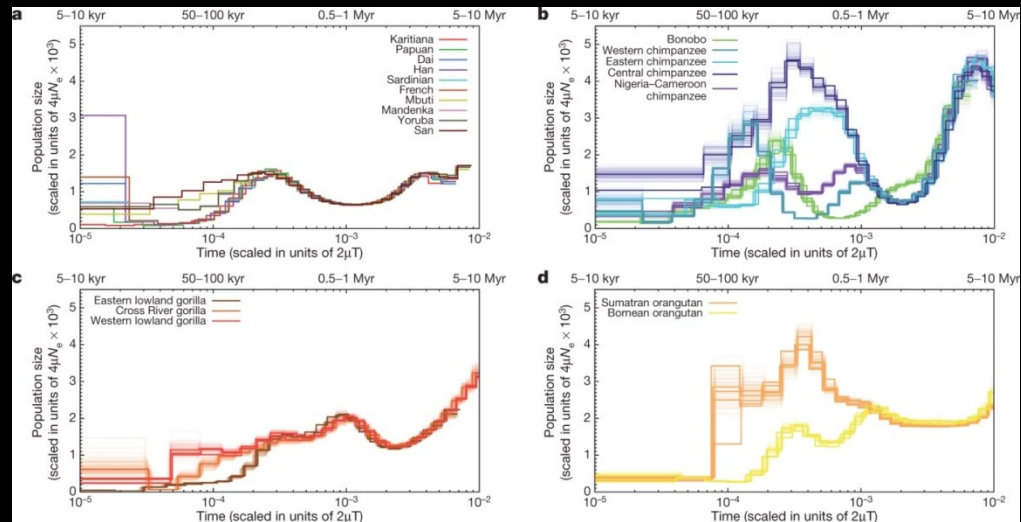

Figure 6. PSMC estimate of the effective population size change over time for collared flycatcher. The black curve is the PSMC estimate for the original data and the grey curves indicate PSMC estimates for 100 bootstrapped sequences. Glacial and interglacial periods of the Late and Middle Pleistocene are indicated by blue and yellow bars, respectively. The interglacial periods corresponds to Marine Isotope Stages: 5e, 7, 9, 11, 13, 15, and 17. The large red-shaded area corresponds to 50% HPDI of the time of divergence (RMASC model). LGP – last glacial period.

Figure 3 Inference of population size from whole-genome sequences. **(a)** Population size estimates from four haplotypes (two phased individuals) from each of nine populations. The dashed line was generated from a reduced data set of only the Native American components of the MXL genomes. Estimates from two haplotypes for CEU and YRI are shown for comparison as dotted lines. N, Northern. **(b)** Population size estimates from eight haplotypes (four phased individuals) from the same populations as in **a** but excluding MXL and MKK. In contrast to estimates with four haplotypes, estimates are more recent. For comparison, we show the result from four haplotypes for CEU, CHB and YRI as dotted lines.

GENETIC DIVERSITY IN A PANMICTIC POPULATION

STANDARD COALESCENT (STATIONARY POPULATION) PREDICTS

- * SHAPE OF THE GENE TREE / GENEALOGY**
- * PATTERNS OF GENETIC DIVERSITY**

GENETIC DIVERSITY WHEN POPULATION SIZE CHANGES

GENETIC DIVERSITY IN THE CASE OF GENE FLOW

GENETIC DIVERSITY IN THE CASE OF GENE FLOW

POPULATION STRUCTURE AND GENE FLOW
* **SHAPE OF THE GENEALOGY**
* **PATTERNS OF GENETIC DIVERSITY**

TO SUMMARISE

- Pop size changes and pop structure modify the shape of gene genealogies
- More specifically population structure often mimics bottlenecks
- (the situation is actually more complex but let us ignore that for a moment)
- (and both can mimic the effect of selection but we will ignore that too, ok?)

Genetics of recent habitat contraction and reduction in population size: does isolation by distance matter?

- population size changes: real or artefacts?
- robustness to population structure?
- Can we use genetic information **alone** to identify the best model (structure *versus* pop size change)?
- How much information? (**sample size versus number of loci** ?)
- Are genomic data the answer?
- Full genomes ? SNPs ?
